PROJECT DESIGN PHASE-II

Solution Requirements

Implement Client Script & UI Policy (Incident)

Problem Statement & Objective

Problem Statement: Incident records often require consistent and accurate data entry to ensure effective triage, routing, and resolution. Relying solely on manual checks leads to incomplete, inconsistent, or incorrect data, impacting reporting accuracy, SLA compliance, and overall service quality. Enforcing conditional field behavior and validation directly at the UI level is essential.

Objective: Demonstrate how ServiceNow client-side controls (UI Policies & Client Scripts) enforce data integrity on Incident records. Dynamically manage field mandatory status, auto-populate values, control visibility, and enforce save-time validation before record submission.

KEY COMPETENCIES: Incident Management | UI Policy | UI Policy Actions | Client Scripts | Form Validation

Functional Requirements (FR)

FR NO.	FUNCTIONAL REQUIREMENT (EPIC)	SUB REQUIREMENT (STORY / SUB-TASK)
FR-1	**Conditional UI Policy Enforcement**	• Dynamically make 'Close Notes' & 'Resolution Code' mandatory when state changes to Resolved. • Hide/Show resolution details section based on Incident State.
FR-2	**Client-Side Field Auto-Population**	• Auto-populate Caller details (Email, Phone, Location) using Client Script onChange. • Set default assignment group based on selected Category.
FR-3	**Form Validation on Submit**	• Validate short description minimum character count on onSubmit. • Prevent submission if priority is 'High' without impact/urgency rationale.
FR-4	**Read-Only & Field Protection Rules**	• Lock Incident number, open date, and created by fields for non-admin users. • Enforce read-only state on closed incidents to preserve audit integrity.

Non-Functional Requirements (NFR)

NFR NO.	NON-FUNCTIONAL REQ	DESCRIPTION
NFR-1	**Usability**	Provide immediate, clear error messaging and smooth field interactions without disrupting user input flow on the Incident form.
NFR-2	**Security**	Prevent unauthorized script manipulation and enforce role-based client-side visibility alongside backend ACL policies.
NFR-3	**Reliability**	Ensure client scripts degrade gracefully and execute reliably across all supported web browsers without breaking form submission.
NFR-4	**Performance**	Optimize client scripts to minimize DOM lookup times and avoid sync g_form server calls to keep form load times under 1.5 seconds.
NFR-5	**Availability**	Ensure UI Policy logic and Client Scripts function continuously across ServiceNow Mobile and Desktop Service Operations Workspaces.
NFR-6	**Scalability**	Structure script logic and UI action conditions modularly so new business rules can be added with minimal maintenance overhead.
